The Life Cycle Of An Apple

There are several ways for you to use these printables.

A quick and easy table top activity: print off the "Sequencing the Life Cycle of an Apple" worksheet.

Students cut off the bottom and then cut and glue the individual pictures to the matching ordinal number position at the top of the paper. Before hand, point out to students that the pictures are numbered.

When everyone has completed their project, use the "teacher cards" on your word wall or pocket chart, to reinforce and review the life cycle (science) as well as the new vocabulary.

If you'd like to involve math, have students choose a partner and take turns rolling a die. Whatever number they roll, is the piece that they cut and glue. If they roll a six, they lose their turn. The first child who completes their life cycle, or the one who has the most squares glued on when the timer rings, is the winner. All children should complete their paper.

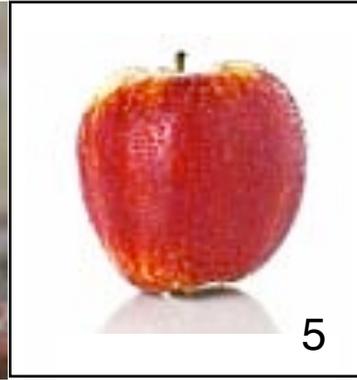

To involve a bit more cutting, plus listening and following directions skills, pre-cut red, yellow and light green construction paper into 10 1/2 by 4 inch strips. Give students a color choice. They cut "slits" on the ordinal number template, so that the "doors" flip up. So that they don't snip off their "flip-up's" remind them to STOP cutting when they run out of a line to follow.

Students rub a line of glue along the top of their ordinal number rectangle (this is the title portion) and glue it to their piece of construction paper.

Children press on the folds to crease them, so that they easily flip up. Students glue the appropriate picture under each flap. When everyone is done, to make sure students have the correct order. review the life cycle.
